REGISTRATION AND STUDY ADMINISTRATIVE

Sign up for study activities at stads selvbetjening within the announced registration period, as you can see on the Studyadministration homepage.

When signing up for study activities, please be aware of potential conflicts between study activities or exam dates.

Registration

The planning of activities at Roskilde University is based on the recommended study programs which do not overlap. However, if you choose optional courses and/or study plans that goes beyond the recommended study programs, an overlap of lectures or exam dates may occur depending on which courses you choose.

Number of participants **ECTS** 5 Responsible

ACADEMIC CONTENT

Overall objective

The overall objective of the course in Probability and Statistics is to endow the student with a fundamental understanding of how the mathematical theory of probability and statistics is constructed, enabling the student to critically reflect on how statistical analysis of data is applied.

Probability theory as an axiomatic mathematical theory:

- The classical mathematical formalisation and clarification of the concepts of probability.
- This includes probability spaces, probability distribution, independence, contingent probability, probability distributions on final, countable quantities and continuous distributions on the real axis

Detailed description of content

• The most common distributions

Statistics:

- Resampling techniques and non-parametric statistics
- Introduction to likelihood-based statistical inference
- Examples

Course material and Reading list

There is no formal text-books in this course. The curriculum consists of former lecture notes which will be handed out through moodle.

The course will be planned as a mixture of lectures and solving of exercises including discussions of exercises.

Overall plan and expected work effort

The workload is 5 ECTS corresponding to 135 hours

The stipulated workload distribution is:

- Pre-class 42 hours
- Classes 42 hours

- Post classes 42 hours
- Exam preparation 10 hours.

Format

The course includes formative evaluation based on dialogue between the students and the teacher(s).

Evaluation

Students are expected to provide constructive critique, feedback and viewpoints during the course if it is needed for the course to have better quality. Every other year at the end of the course, there will also be an evaluation through a questionnaire in SurveyXact. The Study Board will and feedback handle all evaluations along with any comments from the course responsible teacher.

> Furthermore, students can, in accordance with RUCs 'feel free to state your views' strategy through their representatives at the study board, send evaluations, comments or insights form the course to the study board during or after the course.

The course will be planned as a mixture of lectures and solving of exercises including discussions of exercises.

Class by Class program will emerge on Moodle during the course with the following themes.

Probability theory:

• The classical mathematical formalisation and clarification of the concepts of probability.

Programme

- This includes probability spaces, probability distribution, independence, contingent probability, probability distributions on final, countable quantities and continuous distributions on the real axis
- The most common distributions

Statistics:

• Resampling techniques and non-parametric statistics

- Introduction to likelihood-based statistical inference
- Examples

ASSESSMENT

After the course the student will be able to

- compute with and understand the theory behind probability distributions, and model random phenomena using probability theory, stochastic variables and mathematical reasoning,
- apply parametric statistics to data, in particular in formulating hypotheses, assessing estimators, computing test probabilities and interpreting the results using mathematical and statistical reasoning,

Overall learning outcomes

- apply digital tools for statistical investigations, model simulation, and analysis,
- describe and explain the mathematical structure of probability theory,
- demonstrate in-depth understanding of how parametric statistics is built upon probability theory.
- analyse, evaluate and formulate models of stochastic phenomena using mathematical and statistical reasoning.
- present stochastic and statistical theories and methods in a clear and concise manner using mathematical formalism

Individual oral exam without time for preparation.

Time allowed for exam including time used for assessment: 30 minutes.

Form of examination

Permitted support and preparation materials: All.

Assessment: 7-point grading scale. Moderation: Internal co-assessor.

Form of Reexamination Type of examination

Samme som ordinær eksamen / same form as ordinary exam

in special cases

The exam is an individual oral exam without time for preparation.

The exam will begin with a student presentation of a randomly chosen exercise known to the student. The presentation may be interrupted by clarifying questions, and the presentation will be followed by a discussion and questioning within the curriculum of the course.

The Assessement chriteria for the written part of the exam

- compute with and understand the theory behind probability distributions, and model random phenomena using probability theory, stochastic variables and mathematical reasoning,
- apply parametric statistics to data, in particular in formulating hypotheses, assessing estimators, computing test probabilities and interpreting the results using mathematical and statistical reasoning,

Examination and assessment criteria

- apply digital tools for statistical investigations, model simulation, and analysis,
- describe and explain the mathematical structure of probability theory
- demonstrate in-depth understanding of how parametric statistics is built upon probability theory.
- analyse, evaluate and formulate models of stochastic phenomena using mathematical and statistical reasoning.
- present stochastic and statistical theories and methods in a clear and concise manner using mathematical formalism

The assessment of the oral exam is based on the student's ability to meet the criteria mentioned above and their ability to

- clearly present and communicate the scientific content of the course
- engage in a scientific dialogue and discussion with the assessor and co assessor

Furthermore, whether the performance meets all formal requirements in regard to both for the written og oral exam
